(54) A boring apparatus.

(57) A boring apparatus comprises an elongate support body (10) adapted to be rotatable by a machine tool spindle, a cutter mounting body (38) releasably securable to the end of the support body remote from the machine tool spindle and is provided with a cutter guide (52) which slidably receives a cutter (54) therein which is constrained by the guide to be displaceable in an adjustment direction inclined to the rotational axis of the elongate support body (10).

An adjustment member (22) is disposed within the elongate support body and is movable along an axis substantially coaxial with the rotational axis of the elongate support body, and an interengaging coupling (34, 36; 62, 64) on the adjustment member (22) and on the cutting tool (54) is provided whereby movement of the adjustment member along its axis of motion induces movement of the cutting tool in its adjustment direction.
